

VOLMARR WYRD

AI Systems Developer | Agentic Workflow Architect | Vibe Coding Researcher

Angola, Indiana | [linkedin.com/in/volmarr-wyrd](https://www.linkedin.com/in/volmarr-wyrd) | github.com/hrabanazviking | volmarrsheathenism.com

PROFESSIONAL SUMMARY

Independent AI systems developer focused on agentic software, local LLM infrastructure, edge AI, and AI-orchestrated engineering. I design architectures, define constraints and acceptance criteria, direct AI coding agents, test real behavior, diagnose failures, and integrate results into working systems. My development practice centers on building with AI as a coordinated engineering team rather than using it only for autocomplete.

CORE TECHNICAL & AI SKILLS

AI engineering: agent orchestration, AI-assisted coding, task decomposition, prompt/task design, model evaluation, adversarial review, persistent-agent architecture, human-in-the-loop verification

Technical stack: Mojo, Python, CUDA-oriented inference, GGUF, Git/GitHub, Linux/Kubuntu, REST/HTTP APIs, Unix domain sockets, SQLite, JSON, Markdown, local LLMs, Ollama-compatible services, Raspberry Pi / edge hardware

AI tools: OpenAI Codex CLI, ChatGPT, local LLM workflows with LM Studio, Venice AI, and multi-agent LLM collaboration

INDEPENDENT AI SYSTEMS DEVELOPMENT

Independent Developer / Project Lead, RuneForgeAI | 2025-Present

- Architect and lead AI-assisted development of open-source AI infrastructure, autonomous-agent, world-model, and developer-process projects.
- Use a structured architecture-first vibe-coding method: define system boundaries and invariants, decompose work into bounded tasks, delegate implementation/review to specialized AI agents, test against real behavior, document failures, and preserve decisions in living Markdown.
- Own vision, architecture, constraints, debugging strategy, acceptance criteria, integration, and final technical decisions while using AI agents as scalable engineering collaborators.
- Work independently across research, prototyping, debugging, documentation, testing, and iterative system design.

SELECTED PROJECTS

Project A.E.S.I.R. - Advanced Edge System for Interface and Response | Mojo | GGUF | Local LLMs | CUDA | HTTP APIs

- Architected and directed development of an experimental native-Mojo local LLM inference engine intended to run directly on consumer and edge hardware without relying on a large Python inference stack.
- Current verified paths include GGUF model handling, native CPU and NVIDIA GPU inference, interactive local chat, model catalog/verification tools, diagnostics, and local service/API capabilities.
- Worked through model-family/tokenizer compatibility, tensor-layout issues, GPU-memory constraints, KV-cache behavior, deterministic testing, crash recovery, and API integration.
- GitHub: github.com/hrabanazviking/RuneForgeAI-Project-Aesir

Verðandi AI Nervous System | Python | Unix Domain Sockets | Event Bus | Agent Infrastructure

- Designed a real-time local event bus that lets otherwise separate AI processes publish, subscribe to, persist, and react to shared state and events.
- Architecture includes heartbeat/health monitoring, self-healing concepts, event persistence, subscriber management, and integration points for multi-process autonomous agents.

Runa Agent Digital Being | Python | Persistent Agents | Memory | Tool Use | Model Routing

- Designed an autonomous-agent architecture combining durable memory, an event bus, task ledger, model routing, self-repair, tool access, subagents, and multi-surface continuity.
- Built around checkpoints, logs, recovery, verification, and persistent state instead of repeated permission loops.

Mythic Engineering | AI-Orchestrated Software Development Method

- Created and documented an architecture-conscious vibe-coding methodology using specialized AI roles for architecture, implementation, auditing, system mapping, and documentation.
- Emphasizes living documentation, explicit invariants, testing, modular ownership, continuous verification, and preserving context across AI coding sessions.

RELEVANT TO ZERO-PERSON / AI-LED COMPANY EXPERIMENTS

Hands-on experience designing workflows where AI agents perform substantial implementation, review, research, documentation, and operational reasoning while a human supplies goals, judgment, governance, and acceptance criteria. Particularly interested in measuring where autonomy succeeds, where agents drift or fail, and what structures make AI-led work reliable enough to operate continuously.
